

Plummer-Vinson Syndrome

Plummer-Vinson Syndrome which is characterized by the triad of iron deficiency anemia, dysphagia due to esophageal webs and glossitis classically affects caucasian females aged 30-60. This syndrome must be recognized early because it is a risk factor for squamous cell carcinoma of the esophagus.

Triad of Symptoms

Dysphagia

[Dice-fajita](#)

Dysphagia, or trouble swallowing, occurs due to the development of esophageal webs. The dysphagia present in Plummer-Vinson syndrome is typically post-cricoid.

Esophageal Webs

[Esophageal-sarcophagus Webs](#)

Esophageal webs are thin membranes of submucosal and mucosal tissue which can protrude and obstruct the esophagus. This can lead to dysphagia.

Glossitis

[Glass-tongue-on-fire](#)

Glossitis, or inflammation of the tongue, is seen in Plummer-Vinson syndrome, and is often related to nutritional deficiencies. Patients typically display a sore, inflamed tongue. The tongue can be described as "red and shiny," due to inflammation and loss of the lingual papillae.

Iron Deficiency Anemia

[Broken Iron and Anemone](#)

Patients with Plummer-Vinson syndrome also have iron-deficient anemia as part of the symptomatic triad. Iron-deficient anemia is a microcytic, hypochromic anemia which usually occurs due to bleeding, increased demand in pregnancy, or poor nutrition.

Association

Squamous Cell Cancer of Esophagus

[Square-mouse with Tumor-guy at Esophageal-sarcophagus](#)

Patients with PVS display a higher risk of developing esophageal squamous cell cancer.
