

Acute Pancreatitis Assessment

Acute pancreatitis is an acute inflammation of the pancreas commonly caused by gallbladder disease or chronic alcohol intake. Symptoms often include abdominal pain, nausea, vomiting, anorexia, abdominal guarding and rigidity, decreased or absent bowel sounds. Elevated WBCs, generalized jaundice, and hypotension and tachycardia may also be present. Smoking is considered a risk factor.

Mechanism

Heavy Alcohol Use and Gallstones

[Many Alcoholic-martinis and Gold-stones](#)

In the majority of cases, acute pancreatitis is caused by heavy alcohol use and gallstones. Be sure to review our Picmonic on Acute Pancreatitis Causes for more etiologies.

Signs and Symptoms

Abdominal Pain

[Abdominal Pain-bolt](#)

Abdominal pain is usually epigastric and commonly radiates to the back because of the retroperitoneal location of the pancreas. This pain is due to distention of the pancreas, peritoneal irritation, and obstruction of the biliary tract. It typically has a sudden onset and is described as severe, deep, piercing, and continuous or steady.

Nausea/Vomiting/Anorexia

[Vomiting Anorexic-Rex](#)

Patients may complain of nausea, vomiting, and anorexia, which can lead to weight loss.

Abdominal Rigidity/Guarding

[Stone Abdomen being Guarded](#)

Abdominal tenderness with muscle guarding is common as is a rigid, board-like abdomen.

Decreased or Absent Bowel Sounds

[Down-arrow Bowel-bowl Stethoscope](#)

Bowel sounds may become decreased or even absent as a result of an ileus secondary to inflammation, so be sure to perform a thorough gastrointestinal assessment.

Hypotension and Tachycardia

[Hippo-BP with Tac-heart-card](#)

Hypotension and tachycardia may be present in some patients. It is important to monitor for these symptoms because life-threatening shock can occur as a result of pancreatic hemorrhage, excessive fluid volume shifts, or the toxic effects of abdominal sepsis from enzymatic damage.

Jaundice

[Jaundice-janitor](#)

Jaundice, or yellowing of the skin, can occur as a result of edematous pancreatic head obstructing bile flow and is typically generalized. Additionally, other skin assessments to look for include Grey Turner's spots or sign (a bluish flank discoloration on the flanks) and Cullen's sign (a bluish periumbilical discoloration on the periumbilical area).

Increased White Blood Cells

[Up-arrow White Mac-man](#)

Elevated white blood cells, also known as leukocytosis, is another assessment finding. This may be accompanied by a low grade fever.
