

# 12 Lead Contiguous Leads - Septal Wall MI

In a the 12 contiguous leads of an ECG, the septal leads are V1 and V2. Thus, with a septal wall myocardial infarction, we see ST-segment changes and elevation in leads V1 and V2. Septal infarcts stem from insult to the left anterior-descending coronary artery (LAD).

#### Lead V1

V (1) Wand

 $V1\ is\ a\ septal\ lead,\ and\ with\ septal\ wall\ infarctions,\ there\ are\ ST-segment\ changes\ seen\ on\ ECG.$ 

#### Lead V2

V (2) Tutu

On ECG, we see ST-segment changes on lead V2 with septal wall infarcts. Lead V2 is known as a septal lead.

## **Artery Affected**

## Left Anterior Descending (LAD)

**LED LAD** 

The left anterior descending coronary artery, or LAD, is also termed the "widow maker," because it supplies 45-55% of the left ventricle. Occlusion of this artery can lead to septal wall infarct.
