

Airway: Ensure Airway is Still Open

[Open-sign Airway](#)

Before administering rescue breaths, you must ensure that the airway is still accessible to receive the air.

Breathing: Administer 2 Rescue Breaths

[Breathing \(2\) Tutu](#)

After making the airway accessible by tilting the person's head back slightly and lifting the chin, two breaths should be delivered. Blow into the person's mouth to make the chest rise. After the two rescue breaths, compressions should be continued.

Considerations

Repeat C-A-B Sequence (30:2) Until Help Arrives

[Repeat-sign Cab](#)

The CPR sequence of 30 compressions to 2 breaths should be performed until the person exhibits breathing, an AED becomes available, or help arrives on the scene.
